Hosted Microsoft SharePoint 2010, including Anti-Virus

Hosted SharePoint makes it easier for people in business to work together. They can share information, manage projects and collaborate on documents online utilising cloud technology, making Hosted SharePoint an essential platform in today's smart business.

What is Hosted SharePoint?

Hosted SharePoint is the world's leading file and information storage and collaboration platform developed by Microsoft. It's hosted on a high-speed network, providing you with access to your company's files in the cloud, and reducing the IT overhead.

It integrates neatly with Hosted Exchange, Outlook, SharePoint Workspace, and Office, and is available on many other platforms such as the iPhone, iPad, Windows Phone, Android and from any browser.

Hosted Microsoft Sharepoint

ACCESS DOCUMENTS FROM ANYWHERE

Not only can you access your company-wide or personal documents from the desktop, because they're cloud-based, files are securely stored and available from any browser and most mobile devices, including iPhone, iPad, Windows Phone and Android.

ACCESS DOCUMENTS FROM A SINGLE PLACE

Instead of having your documents distributed throughout your business, use Hosted SharePoint to centralise document storage. Bring order to the active documents in your business using Hosted SharePoint.

WORKING TOGETHER IS EASY

Hosted SharePoint allows teams within your workplace to collaborate on the same document, sharing information and intelligently tracking changes made. SharePoint can roll-up updates into a single document without the worry of overwriting data.

CONTROL ACCESS TO DOCUMENTS

Hosted SharePoint helps you to manage your document permissions by allowing site-wide or individual file control over who sees what. Using SharePoint, you can effectively and cleverly manage the workflow in your client's business.

Every SharePoint user account is protected by Anti-Virus technology to help ensure the files moved to and from the cloud are free from viruses and other harmful content.

Anti-Virus has been embedded directly into Hosted SharePoint, providing behind-the-scenes protection for you the client.

Whenever you connect to Hosted SharePoint, you do so using a GeoTrust secure SSL certificate with industry-standard 128-bit encryption and 99% browser support.
